

I do not understand the need for any GMO grass seed for lawns or any other application. Why would we take such a risk? The potential number of lawns seeded with GMO grass is enormous. The year-to-year spraying of roundup on those lawns just to control weeds is not only scary, but dangerous. How many gallons of roundup would that amount to per household and business over an entire year. What about 10 years. We would be creating a vast dead zone for everything but GMO grass. We don't need to take such enormous risks for the sake of a green lawn. There are too many unknowns. We have all heard about Antibiotic resistance and the problem it causes. Well, roundup appears to be the antibiotic for weeds.

Please ban GMO grass. I support SB 443 if it bans the sale of GMO grass in Connecticut.
